

EXECUTIVE CASE STUDY

Proving Typography Drives Revenue

How I rebuilt font discovery into one of the top premium-conversion drivers inside Adobe Express, Adobe's freemium design app.

+186%

Free-to-paid conversion lift in Adobe Express (0.5% → 1.42%), from a font-recommendation redesign I drove across product, design, and engineering.

*Everyone saw font discovery as a commodity feature. I saw an **under-monetized conversion lever**, and the data proved me right.*

73.7% vs. 37.3%

Export rate for users who applied a recommended font, versus all Express users. Nearly 2× more likely to finish and keep their work.

6.3×

More trial conversions in matched 45-day windows, before versus after launch.

THE STORY

CHALLENGE

Friction, not revenue.

Font discovery was a dead end. Recommendations and the font menu were **two separate experiences**, and the legacy suggestions ignored what the user was actually making. Users defaulted instead of choosing, and premium fonts looked **arbitrary, not worth paying for**.

APPROACH

A lab to de-risk the bet.

Designated Adobe Express as the flagship launch partner for contextual font recommendations, surfacing the right font at the right moment. Validated first on Adobe's font website, **millions of unique users every month**, then rolled it out in-app after aligning Express leadership behind the results.

RESULT

Conversion nearly tripled.

I turned typography from an unmeasured feature into one of Express's top premium-conversion drivers.

THE PLAYBOOK

01

Find the undervalued asset.

Typography: used by everyone, bundled into a subscription, credited to no one.

02

Prove its worth.

Instrument the behavior, test on the website lab, validate with A/B data.

03

Scale it through influence.

Win alignment from teams you don't manage by making the result theirs.
